

Neighborhoods & Niches: Spatial Characterization of SIV Reservoirs in NHP Lymphoid Tissues

CASE STUDY

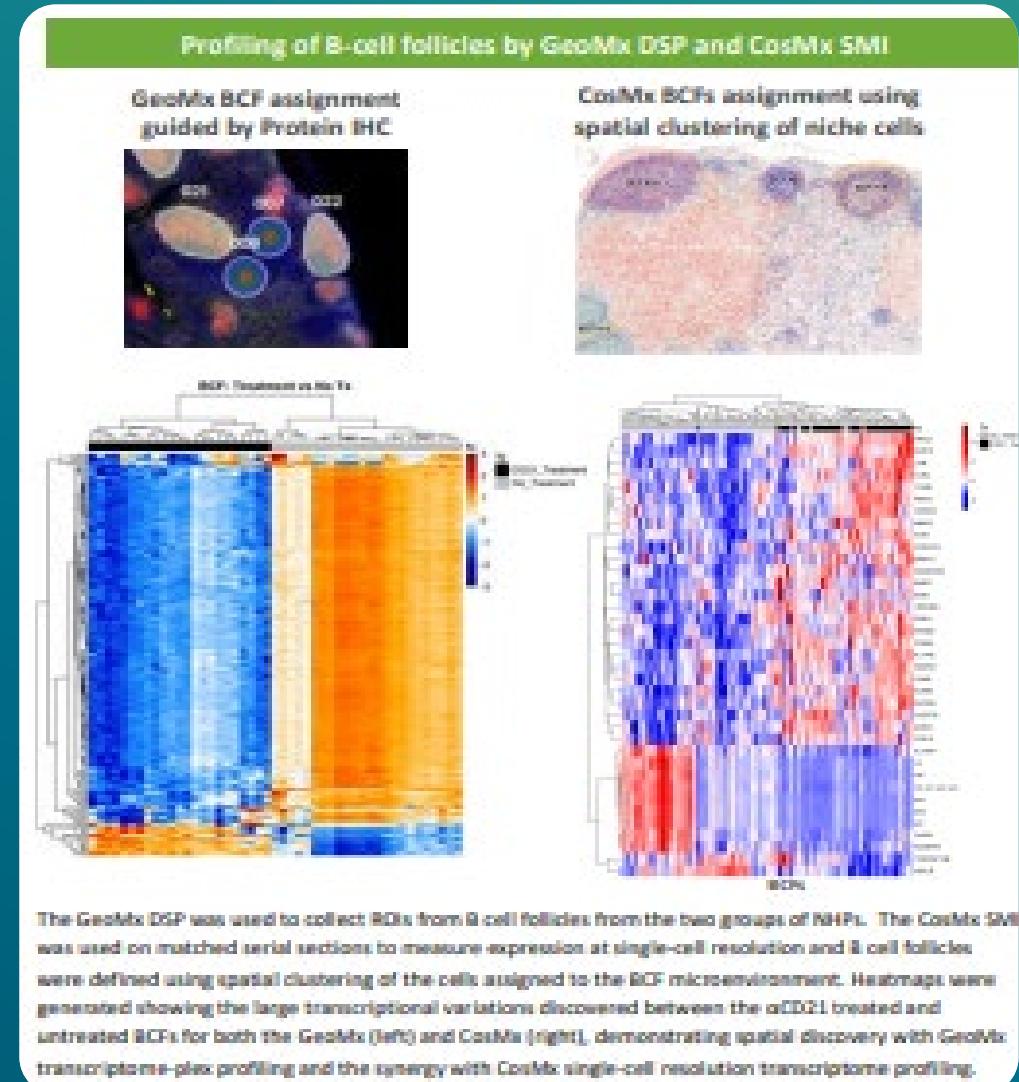

Jake Estes, PhD
Professor and Chief
VGTI and ONPRC, OHSU

nanoString®

Spatial Landscape of productively infected from uninfected Cells in SIV reservoirs

- Spatial imaging and profiling provide **insight beyond what is available from bulk analyses** and show the role of viral reservoirs in the context of their cellular immune neighborhoods
- These results **improve our understanding of NHPs as a model system for HIV and may lead to potential treatment** options to eliminate the entirety of the viral reservoir in the infected individual

Spatial Characterization of SIV Reservoirs

Background

- Persistent cure against HIV infection is still missing

Research question

- What is the **impact of αCD21 treatment**, attenuating the binding and retainment of virions on **Follicular Dendritic cells (FDCs) in the lymph nodes?**
- What are the **spatial host-viral interactions that allow HIV reservoirs to persist** in lymph nodes?

Experimental design

- Compare transcriptional profiles in infected versus uninfected lymph nodes (FDCs)

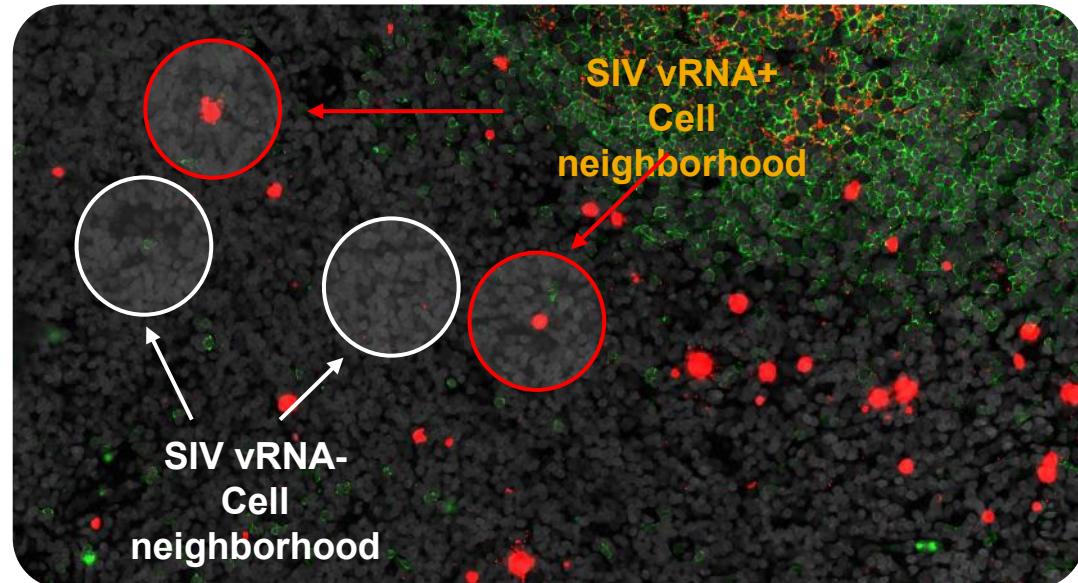

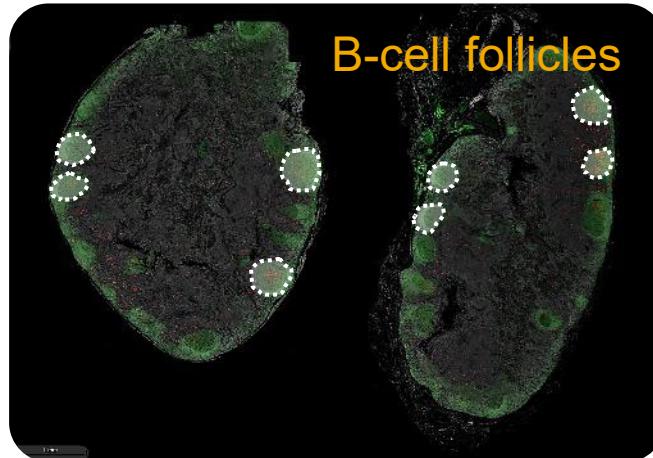

Study Details	
Research area:	Infectious Diseases, HIV
Organism and tissue:	NHP (Rhesus macaques) lymph node
Sample type:	FFPE (5um sections)
Instrument:	GeoMx®, CosMx™
Analyte:	RNA
Readout:	NGS, CosMx
Assay:	GeoMx: CTA, CosMx: 1000-plex SMI panel with spike-in for 9 SIV genes probes
Journal, Year:	Presentation at AGBT 2022

Surveying the Right Neighborhoods to Understand the Biology of SIV Infected Cells in Treated Vs Control Animals

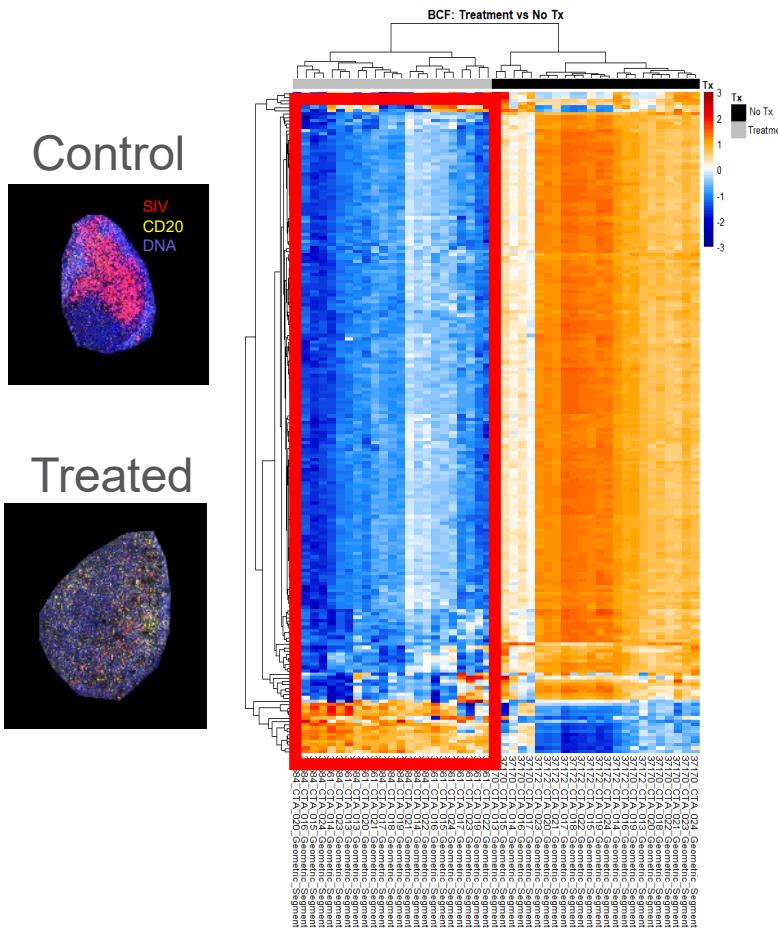

Morphology markers for ROI selection & profiling with the GeoMx® DSP platform

Segment	Target	Channel
Syto 13	DNA	488nm
B-cells	CD20	532nm
Viral particles	SIV vRNA	647nm

- αCD21 treated versus control animals
- Virus positive versus virus negative regions

Immune Profiles of SIV RNA+ and adjacent SIV- Cellular Neighborhoods

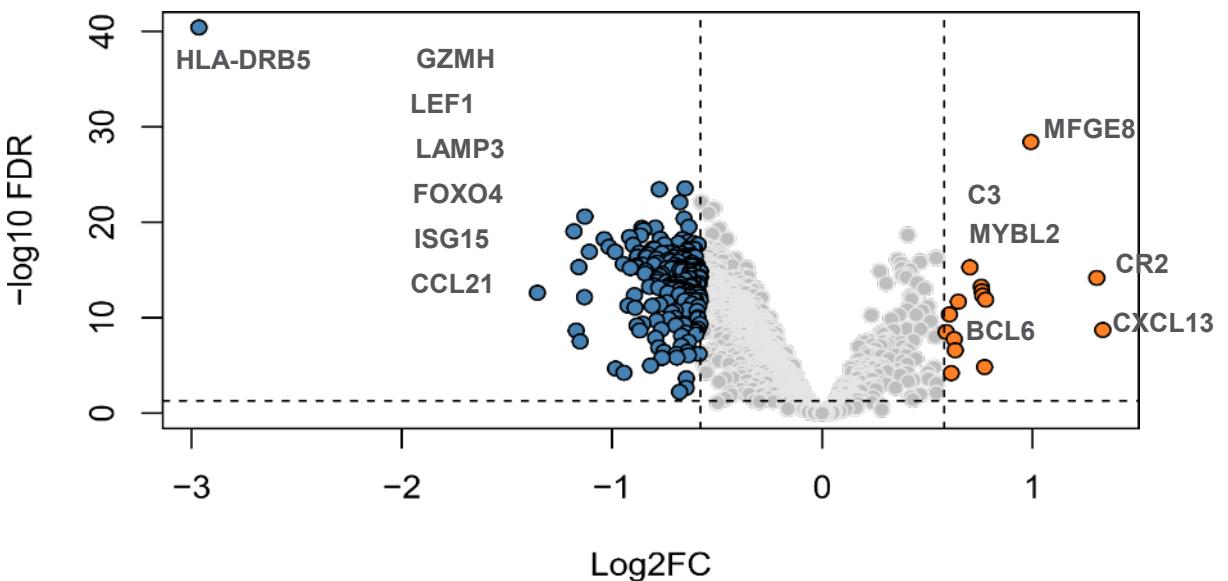

Treatment results in substantial
Down-Regulation:

MHC-I and MHC-II PRES.
DC FUNCTION
CTL/NK CELL FUNCTION
T CELL ACTIVATION
TYPE 1 IFN RESPONSES

Up-Regulation:

CELL ADHESION
CELL MIGRATION
COMPLEMENT
CELL PROLIFERATION
B CELL SIGNALING

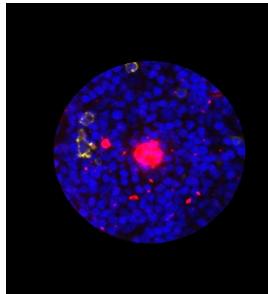

GeoMx profiles reveal gene expression changes with treatment

GeoMx Profiling Reveals Immune Environments of Infected Cells

SIV+ Center

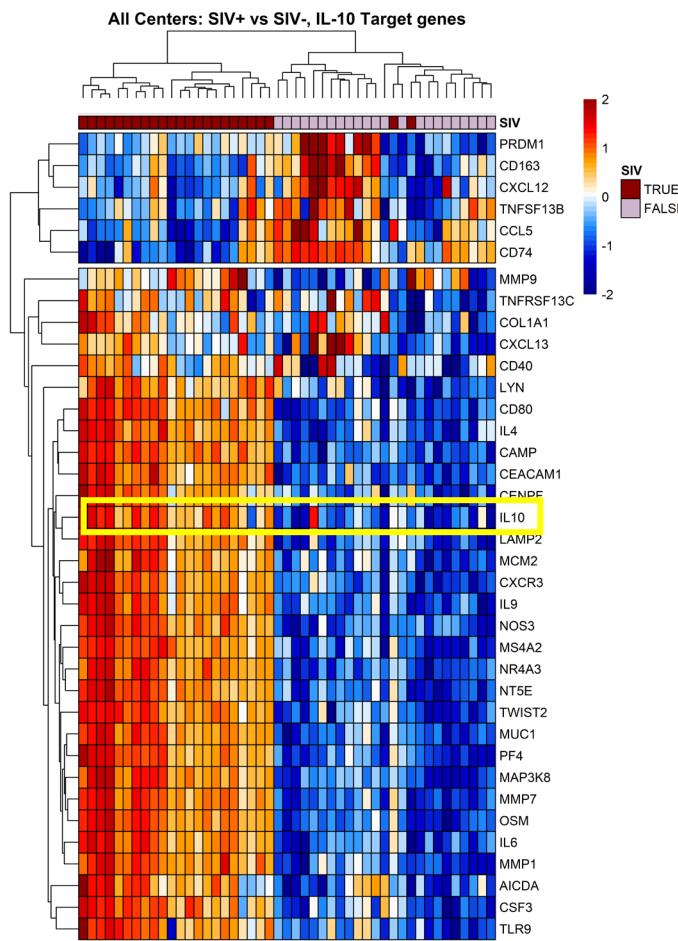

SIV- Center

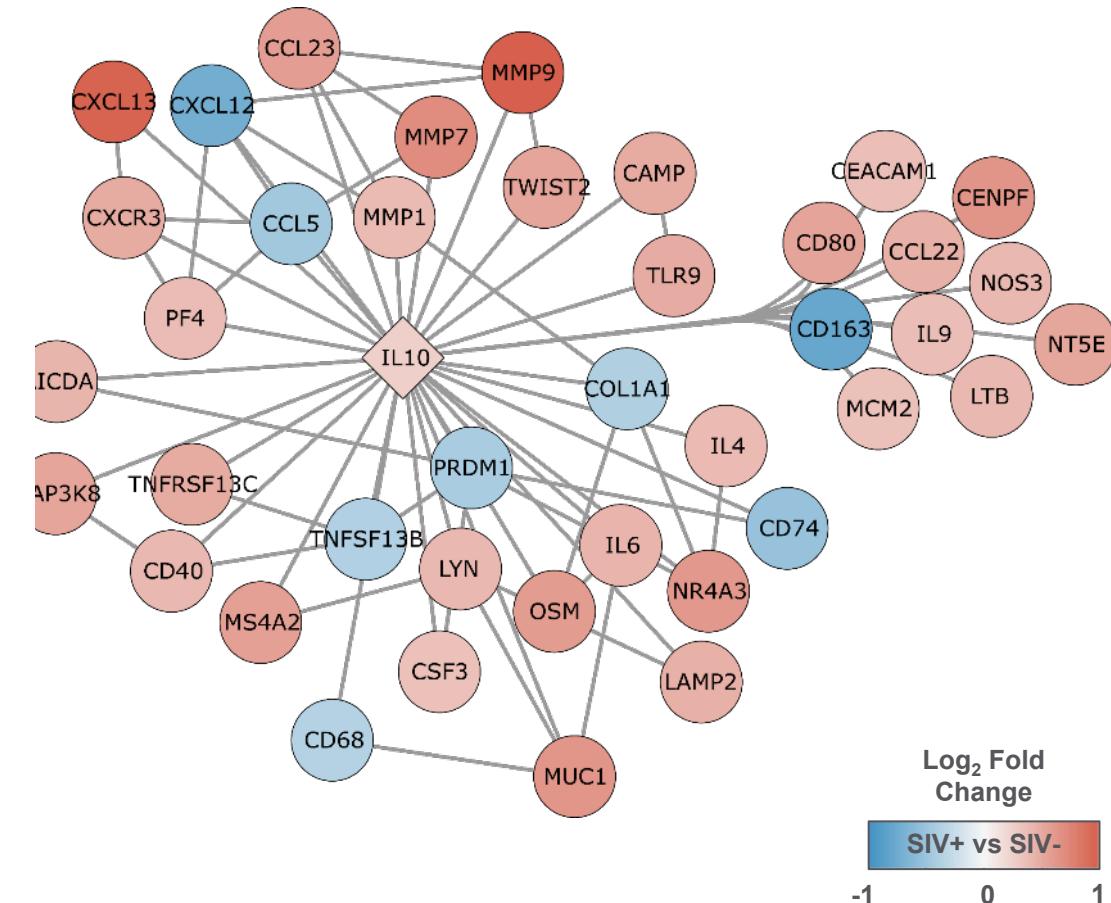

IL-10 was a significant upstream regulator ($p=2.14 \times 10^{-23}$) for genes DE between SIV+ and SIV- centers.

Heatmap of IL-10 and its targets shows that these genes are primarily up-regulated in SIV+ centers.

Upstream Regulator & Targets:
Ingenuity Pathway Analysis

CosMx™ Resolves Infection Status at Single & Sub-cellular Level

3- Dimensional SMI Subcellular localization of SIV RNA discriminates productive infection from virions trapped on follicular dendritic cells within B cell follicles

3D visualization of SIV transcripts indicates that a subset of single cells have high viral gene content at the intracellular location (vRNA+), while the others are located outside of single cells (virions). Examples (Left) show productively infected T cells (top) and uninfected follicular dendritic cell networks (bottom).

Key Takeaways

Results

- Identified genes associated with viral persistence and treatment response (IL10 and targets)
- Resolved infection-associated gene expression at the level of tissue microenvironments
- Differentiated *in situ* between productively infected cells versus surface bound

Conclusions

- Able to identify unique biomarkers associated with viral persistence
- Targeted interventions may eliminate persistence in an HIV cure strategy

GeoMx/CosMx Edge

- Gene Expression Profiling and Single Cell Imaging together allow a comprehensive and accurate spatial survey of SIV infected and non-infected tissue neighborhoods at all scales, thus allowing **for the first time, an ability to discriminate between productively infected Vs. uninfected SIV reservoirs at a subcellular resolution**
